## **Python Programming Fundamentals Cheat Sheet**

Description	Syntax and Code Example
Returns `True` if both statement1 and statement2 are `True`. Otherwise, returns `False`.	<pre>Syntax:     1. 1     1. statement1 and statement2  Copied!  Example:  1. 1     2. 2     3. 3     4. 4     5. 5     6. 6     7. 7     8. 8     9. 9  1. marks = 90 2. attendance_percentage = 87 3. 4. if marks &gt;= 80 and attendance_percentage &gt;= 85:</pre>
Defines a blueprint for creating objects and defining their attributes and behaviors.	<pre>5.  print("qualify for honors") 6. else: 7.  print("Not qualified for honors") 8. 9.  # Output = qualify for honors  Copied!  Syntax: 1. 1 1. class ClassName: # Class attributes and methods  Copied!  Example: 1. 1 2. 2 3. 3 4. 4 1. class Person: 2.  definit(self, name, age): 3.  self.name = name 4.  self.age = age  Copied!  Syntax: 1. 1</pre>
A`function` is a reusable block of code that performs a specific task or set of tasks when called.	<ol> <li>def function_name(parameters): # Function body</li> <li>Copied!</li> <li>Example:</li> <li>1</li> <li>def greet(name): print("Hello,", name)</li> </ol>
Checks if two values are equal.	Copied! Syntax:  1. 1 1. variable1 == variable2  Copied!  Example 1: 1. 1 1. 5 == 5  Copied!  returns True  Example 2: 1. 1
	Returns `True` if both statement1 and statement2 are `True`. Otherwise, returns `False`.  Defines a blueprint for creating objects and defining their attributes and behaviors.  A`function` is a reusable block of code that performs a specific task or set of tasks when called.

```
Copied!
                                                                                        returns False
                                                                                        Syntax:
                                                                                          1. 1
                                                                                          1. for variable in sequence: # Code to repeat
                                                                                         Copied!
                                                                                        Example 1:
                       A`for` loop repeatedly executes a block of code for a specified
                                                                                          1. for num in range(1, 10):
                                                                                          2.
                                                                                                  print(num)
For Loop
                       number of iterations or over a sequence of elements (list, range,
                       string, etc.).
                                                                                         Copied!
                                                                                        Example 2:
                                                                                          1. 1
2. 2
3. 3
                                                                                          1. fruits = ["apple", "banana", "orange", "grape", "kiwi"]
2. for fruit in fruits:
3.    print(fruit)
                                                                                        Copied!
                                                                                        Syntax:
                                                                                          1. 1
                                                                                          1. function_name(arguments)
                                                                                         Copied!
                       A function call is the act of executing the code within the function
Function Call
                       using the provided arguments.
                                                                                        Example:
                                                                                          1. 1
                                                                                          1. greet("Alice")
                                                                                        Copied!
                                                                                        Syntax:
                                                                                          1. 1
                                                                                          1. variable1 >= variable2
                                                                                        Copied!
                                                                                        Example 1:
                                                                                          1. 1
                                                                                          1. 5 >= 5 and 9 >= 5
                                                                                        Copied!
Greater Than or Equal Checks if the value of variable 1 is greater than or equal to
                       variable2.
To(>=)
                                                                                        returns True
                                                                                        Example 2:
                                                                                          1. 1
2. 2
3. 3
                                                                                          1. quantity = 105
                                                                                          2. minimum = 100
                                                                                          3. quantity >= minimum
                                                                                         Copied!
                                                                                        returns True
Greater Than(>)
                      Checks if the value of variable 1 is greater than variable 2.
                                                                                        Syntax:
                                                                                          1. variable1 > variable2
                                                                                        Copied!
                                                                                        Example 1: 9 > 6
                                                                                        returns True
```

1. age = 25 age == 30

```
Example 2:
                                                                                                       1. 1
2. 2
3. 3
                                                                                                       1. age = 20
2. max_age = 25
3. age > max_age
                                                                                                    Copied!
                                                                                                    returns False
                                                                                                    Syntax:
                                                                                                       1. 1
                                                                                                       1. if condition: #code block for if statement
                                                                                                     Copied!
If Statement
                          Executes code block `if` the condition is `True`.
                                                                                                    Example:
                                                                                                       1. 1
2. 2
                                                                                                       1. if temperature > 30:
2. print("It's a hot day!")
                                                                                                     Copied!
                                                                                                    Syntax:
                                                                                                       1. 1

3. a != b
Not Equal(!=)
                        Checks if two values are not equal.
                                                                                              Copied!
                                                                                              returns True
                                                                                              Example 2:
                                                                                                1. 1
2. 2
                                                                                                1. count=0
                                                                                                2. count != 0
                                                                                               Copied!
                                                                                              returns False
                                                                                              Syntax:
                                                                                                1. 1
                                                                                                1. object_name = ClassName(arguments)
                                                                                               Copied!
Object Creation
                        Creates an instance of a class (object) using the class constructor.
                                                                                              Example:
                                                                                                1. 1
                                                                                                1. person1 = Person("Alice", 25)
                                                                                              Copied!
OR
                        Returns `True` if either statement1 or statement2 (or both) are
                                                                                              Syntax:
                         `True`. Otherwise, returns `False`.
                                                                                                1. 1
                                                                                                1. statement1 || statement2
                                                                                              Copied!
